Enlight Layer

Custom AI monitoring on cameras and sensors — for the places nobody watches.

Start the deck ↓

Jump to the services

Cameras record. Nobody watches.

01 **Rounds miss the in-between.**

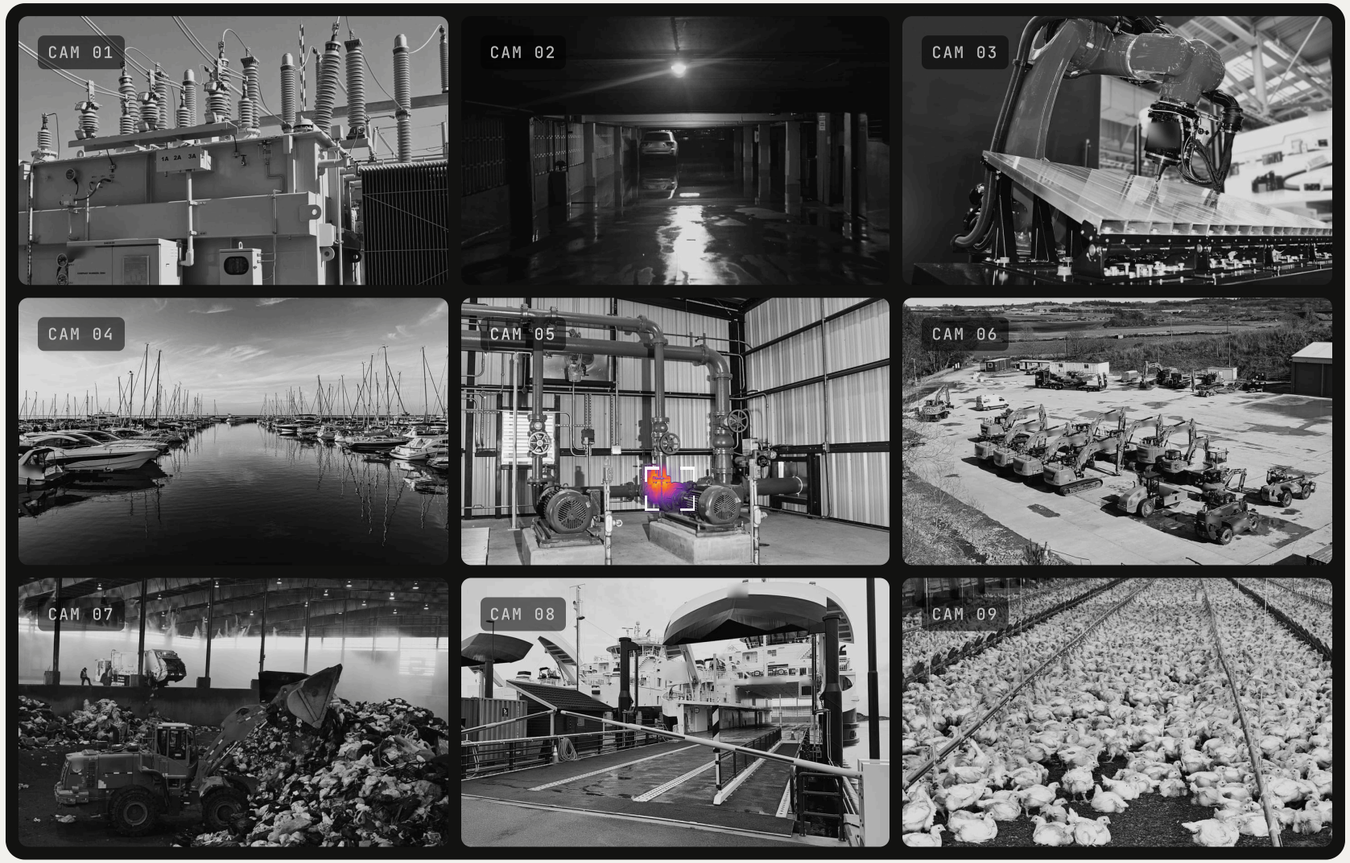

Plants, stations and buildings are still checked by people on foot. Most problems start between two rounds.

02 **Old equipment is offline.**

The gauges, panels and machines that run critical sites were built before the internet. Replacing them costs a fortune.

03 **Video AI stops at the obvious.**

Off-the-shelf analytics counts people and spots intruders. The specific, expensive problems are left to chance.

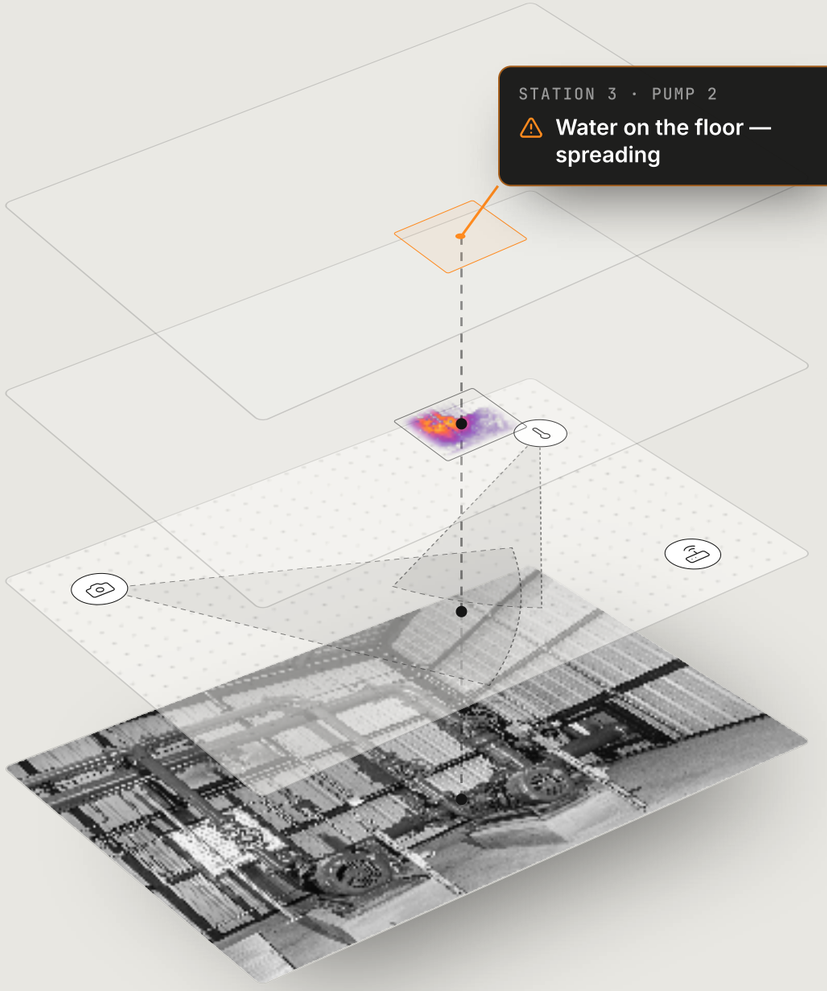

Nine feeds. One problem in progress — and nobody looking at CAM 05.

One layer on top of what's already there.

We build a custom AI monitor for each problem — on the customer's cameras where they can see enough, with new cameras or sensors where they can't.

- Custom-built for each problem
- Existing cameras first
- An alert with the picture — not a video wall

L3 · ACTION
An alert with the picture, to the person who acts.

L2 · INTELLIGENCE
A model for one problem, at one site.

L1 · SENSING
Existing cameras first, sensors where needed.

L0 · PHYSICAL
The site as it is.

Niche on purpose.

Each service solves one specific, costly problem that cameras and AI can already handle — but that nobody has packaged. Generic video analytics leaves them alone. That's where we go.

01
Rounds & readings
- Old panels online
- Control rounds
- Proof of inspection

02
Water & flooding
- Pump stations
- Sewers & flood defences
- Underpass floods
- Garage floods

03
Machines & energy
- Machine health
- Robot cells
- Winch brakes
- Substations
- Waste fires

04
People safety
- Construction HSE
- Range flagging
- Ride zones
- Trampoline parks
- Fall alerts

05
Water at night
- Marinas
- Ferry quays
- Pools after hours

06
Farms & animals
- Barn behaviour
- Predator warning

07
Operations & retail
- Truck waiting
- Equipment yards
- Mall statistics
- Self-checkout

Old equipment online — at about 1/25 of the price.

Most sites run on equipment that was never connected. Replacing the control system means new panels, rewiring and downtime. We point a camera at what's already there.

COST TO GET ONE OLD PANEL ONLINE

Replacing the control system ≈ 25×

New panels, wiring, integration, downtime

Enlight Layer camera retrofit 1×

Camera, model and alerts on the existing panel

Our estimate for a typical retrofit. Every site is quoted individually.

No shutdown

Nothing is opened, rewired or replaced.

Data from day one

Every reading, every minute, with history.

Any brand, any age

If a person can read it, a camera can.

Old equipment, read by camera.

Panels, gauges and inspection rounds — digitised without touching the equipment.

01 Old equipment, online

A camera in front of an old panel reads its dials, displays and lamps the way an operator would — and turns them into live data and alerts.

ALERT WHEN

Pressure on gauge P-3 stays above 6 bar for 5 minutes.

FOR

Industrial plants, utilities, hospitals and property owners with equipment older than their network.

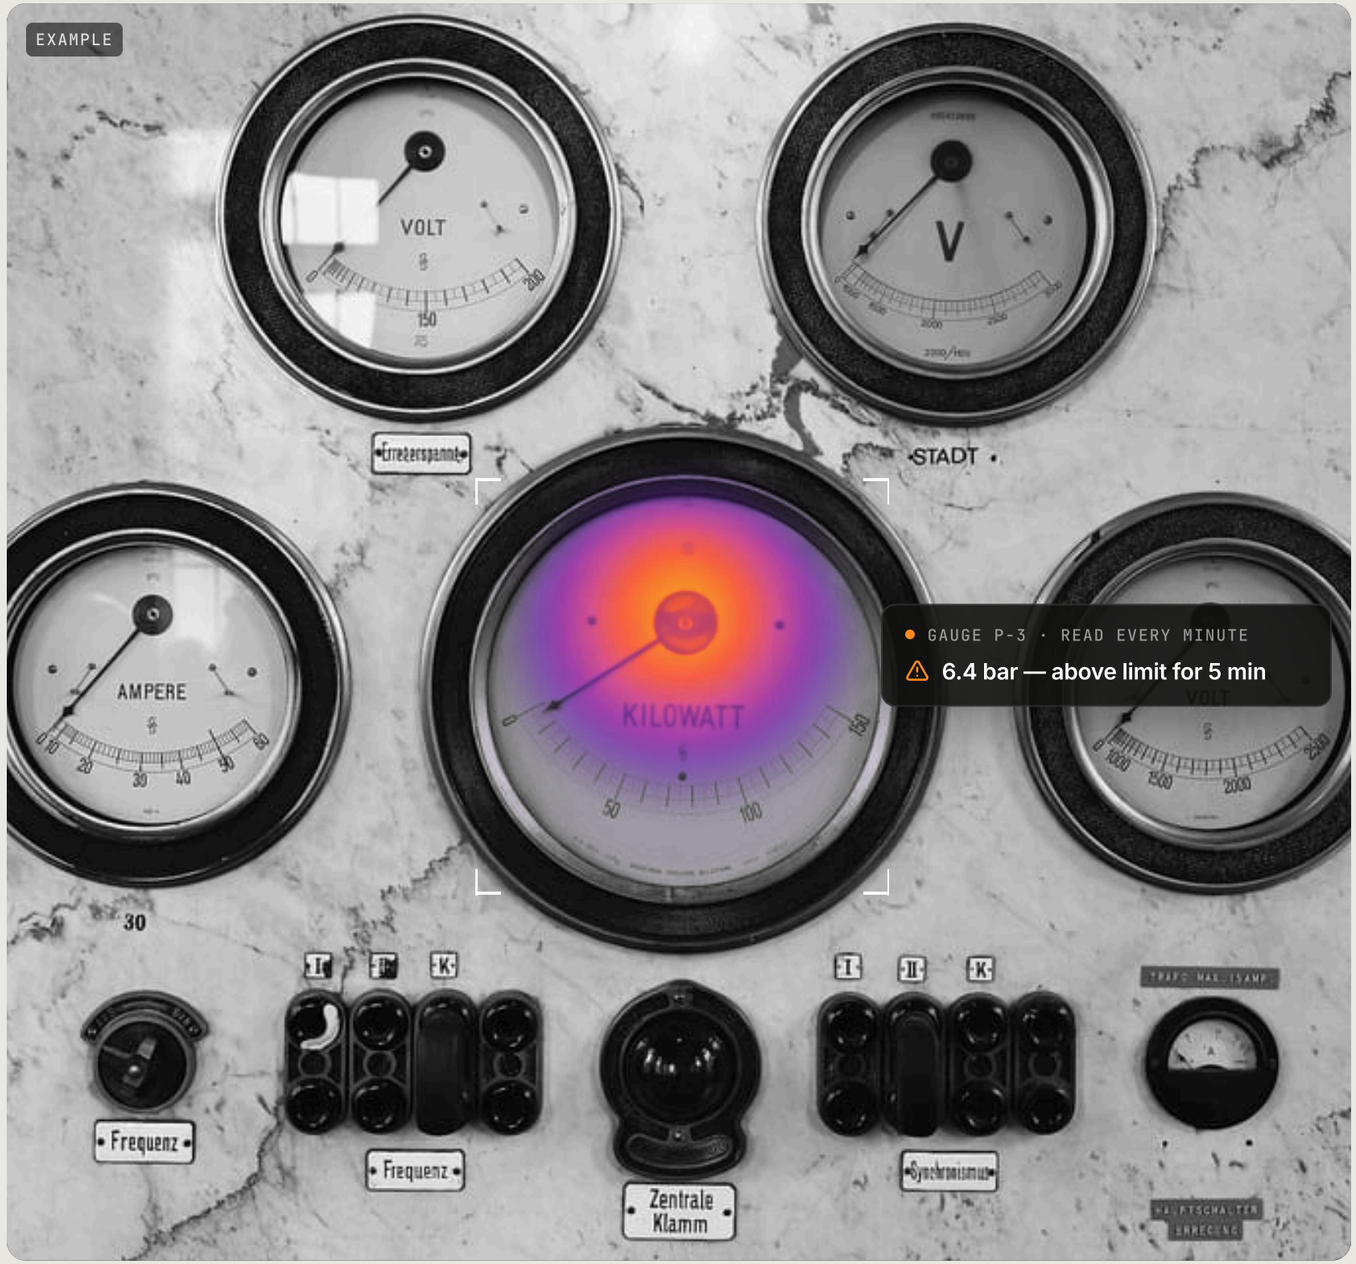

WHY IT PAYS

Digitised at about 1/25 of the price of replacing the system — no rewiring, no shutdown.

CAMERA

02 Digital control rounds

03 Proof of inspection

Water where it shouldn't be.

Unmanned stations, sewers and low points — watched between visits.

01 Unmanned pump stations

Watches pumps, flanges, pipes and the floor for visible leaks or beginning flooding — between visits.

ALERT WHEN

Water spreads across the floor under pump 2, or the door opens with no visit planned.

FOR

Municipal water and wastewater utilities, waterworks and industrial companies — including stormwater pump stations.

WHY IT PAYS

Critical infrastructure gets active monitoring instead of a weekly visit.

CAMERA THERMAL

02 Sewers & flood defences

03 Underpass flood warning

04 Parking garage flood watch

Machines that warn before they fail.

Heat and vibration show most faults days or weeks before the breakdown.

01 Machine health

Thermal cameras and vibration sensors follow every fixed motor, pump, fan and gearbox — and show when a fault is on its way.

ALERT WHEN

A bearing runs 15 °C above its twin for 30 minutes, or vibration has risen three weeks in a row.

FOR

Process industry, utilities, food production, mining and aquaculture — any site with critical rotating equipment.

WHY IT PAYS

Planned repairs instead of breakdowns.

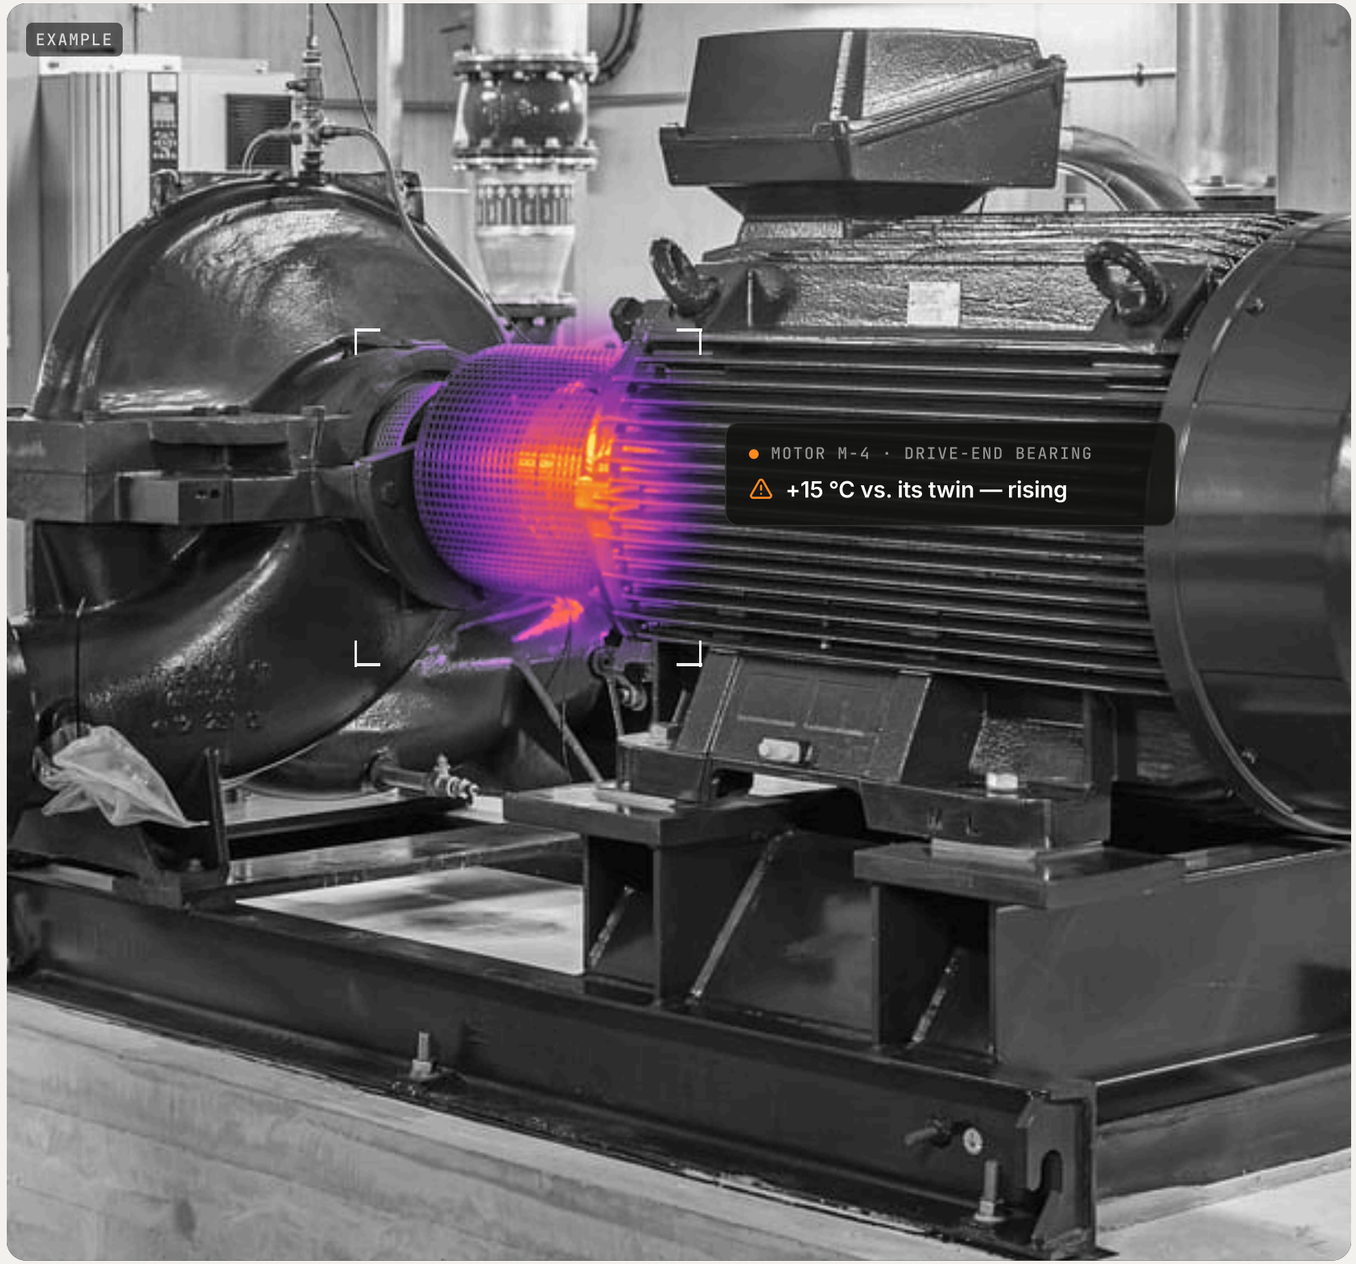

THERMAL VIBRATION

02 Robot & welding cells

03 Offshore winch brakes

04 Transformers & substations

05 Waste & recycling fires

The second someone is in the wrong place.

Sites where the risk is a person in a danger zone — or a person who doesn't get up.

01 Construction site safety

Watches the whole site for the situations that lead to accidents — and tells the site manager right away.

ALERT WHEN

A person walks into the excavator's swing radius while it is working.

FOR

Contractors, construction companies and project owners.

WHY IT PAYS

Fewer near-misses, documented HSE work, safer sites.

CAMERA Detects situations, not identities — no face recognition.

02 Shooting range safety

03 Ride danger zones

04 Trampoline parks

05 Falls in care and at home

Water, darkness and nobody on duty.

Marinas, ferry quays and pools after closing.

01 Marinas & harbours

Sees a person fall from the dock, people on the docks after closing, and someone standing still too long at the water's edge.

ALERT WHEN

A person goes into the water, or someone is on the docks after 23:00.

FOR

Private marinas, yacht clubs, resorts and harbour operators.

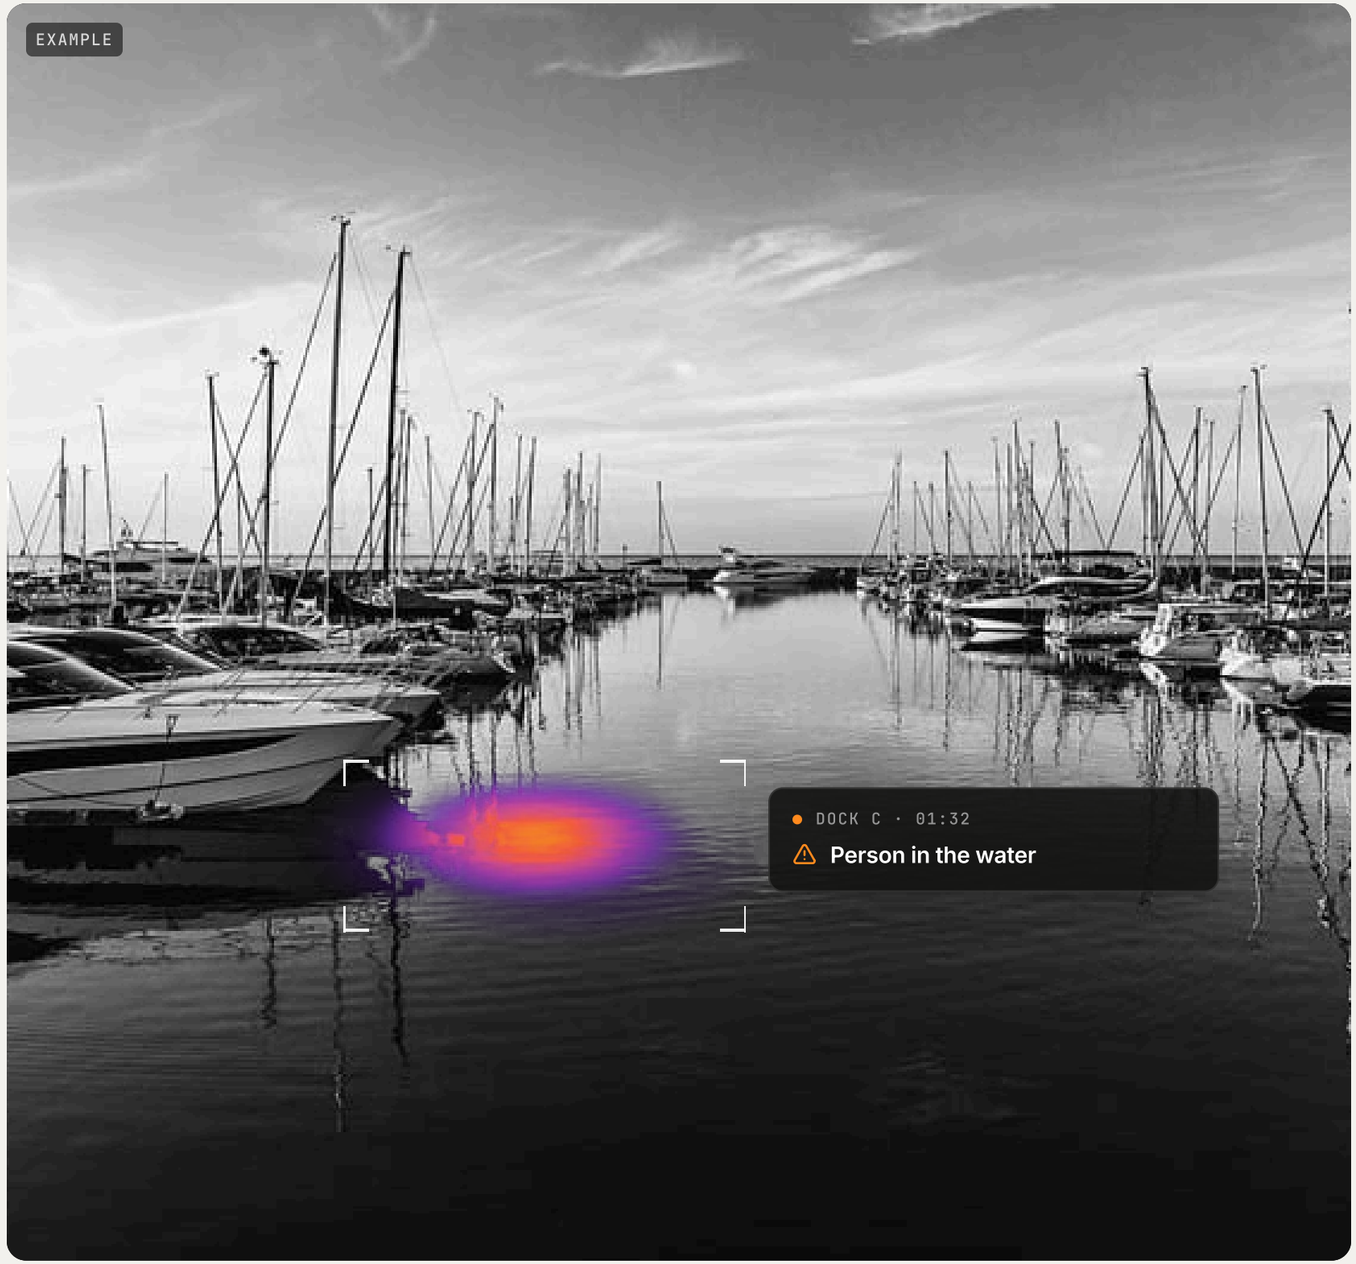

WHY IT PAYS

When someone falls in at night, minutes decide.

CAMERA THERMAL

02 Ferry quays at night

03 Hotel pools after closing

Animals, watched through the night.

Behaviour inside the barn and predators at the fence.

01 Barn behaviour

Measures activity, how the animals spread out and unusual changes at group level — and warns if an animal may have died.

ALERT WHEN

The flock avoids one zone for 30 minutes, or an animal has not moved for 4 hours.

FOR

Poultry producers and larger livestock farms.

WHY IT PAYS

Earlier signs of problems with ventilation, water, feed or health.

CAMERA THERMAL

Biological signals are checked and interpreted by the farm's responsible staff.

02 Predator warning

Time, traffic and loss — measured.

Queues at the gate, machines in the yard, people on the shop floor.

01 Truck waiting times

Records how long every truck waits at the gate, in the queue and at loading — and compares it by carrier, time and job.

ALERT WHEN

A truck has queued for more than 45 minutes, or one carrier waits twice as long as the rest.

FOR

Port terminals, grain receiving, wholesalers and industrial sites.

WHY IT PAYS

Fewer delays and better-planned arrivals.

CAMERA

02 Equipment rental yards

03 Shopping centre statistics

04 Self-checkout loss

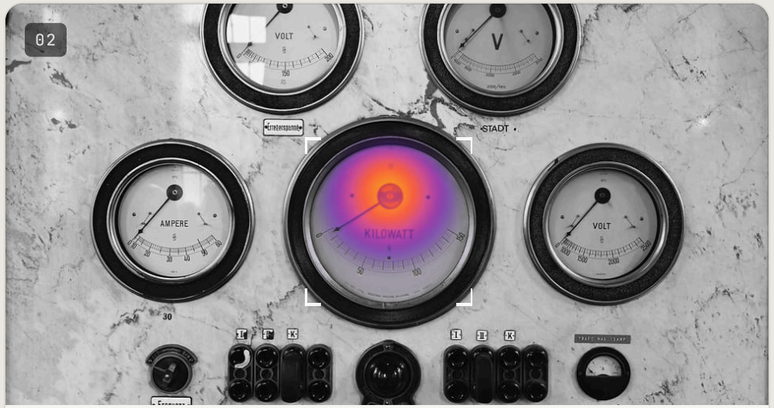

On what's there — or with what's missing.

Every project mixes three ways in. We only add hardware where the problem needs it.

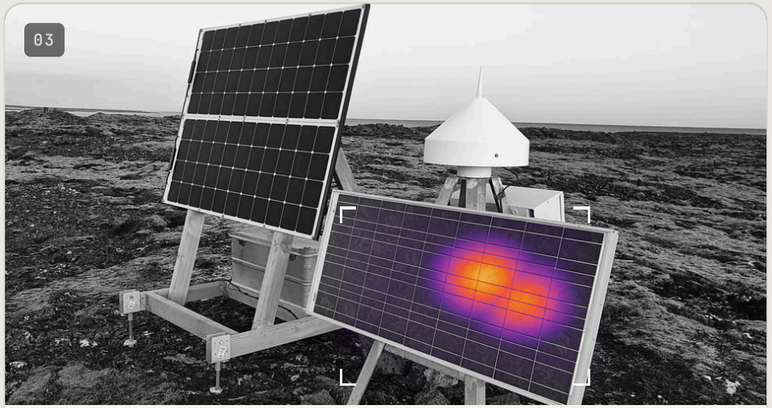

Existing cameras

Many sites can start with the cameras they already have — software only.

Camera on old equipment

A camera in front of a panel, a sensor on a motor. Nothing opened, nothing rewired.

New hardware, remote sites

Thermal cameras, sensors and a 4G/5G gateway — on mains or solar power, where there is no network at all.

FROM FIRST CALL TO FIRST ALERT

01 Scope →

One problem at one site. A few camera stills, and what an alert should mean.

02 Pilot →

A few weeks on one site, tuned with the people who will get the alerts.

03 Roll out →

More cameras, more sites — on the same layer.

04 Run

We watch the models and keep improving them.

Analysis runs on site, in the cloud, or split between them.

Private by design.

Several services watch places where people are. They are built for European privacy rules from the start.

Situations, not identities

We detect events — a fall, a hot bearing, a person in a danger zone. No face recognition.

Data stays where it should

Analysis can run on site, so only the event and a snapshot leave it.

People decide

Every alert goes to a person who decides what to do next.

An extra layer, not a replacement

We add to certified safety systems, lifeguards and inspections — never replace them.

Europe and North America.

The same problems exist wherever there are old stations, unmanned sites and expensive equipment.

WHY NOW

01 **Cameras are everywhere**
Most sites already have cameras that nobody watches.

02 **Sensors are cheap**
Thermal cameras and vibration sensors cost a fraction of what they used to.

03 **AI runs on site**
Models now run on a small box on site, so video doesn't have to leave the site.

04 **Old infrastructure stays**
It isn't being replaced fast enough — but it can be read.

WHO BUYS

- Municipal water & wastewater
- Waterworks
- Grid operators
- Process industry
- Manufacturers
- Construction
- Waste & recycling
- Ports & terminals
- Offshore & heavy lift
- Machine rental
- Poultry & livestock
- Sheep farmers
- Shopping centres
- Grocery retail
- Hotels & resorts
- Marinas & yacht clubs
- Ferry operators
- Amusement & trampoline parks
- Shooting ranges
- Care homes & home care
- Road authorities
- Parking operators

Customer types the services are built for — not a list of customers. Every project is a custom solution for one company.

Let's find the first site.

Tell us about one problem at one site. We'll tell you what a camera could catch — and what it would take.
